

Usage of **Linked Data**

Introduction and Application Scenarios

Presented by:
Barry Norton

Agenda

- 1. Motivation Scenario**
- 2. Linked Data Foundations**
- 3. Introduction to Linked Data**
- 4. Linked Data use case scenarios**

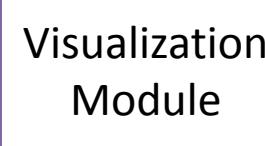

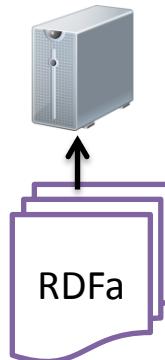

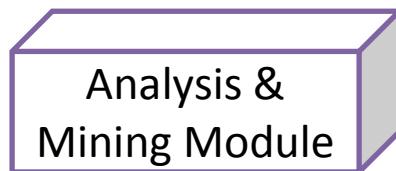

MOTIVATION SCENARIO

Music!

- Provision of a music-based portal.
- Bring together a number of disparate components of data-oriented content:
 1. **Musical content** (streaming data & downloads)
 2. **Music and artist metadata**
 3. **Review content**
 4. **Visual content** (pictures of artists & albums)

Music!

Expected Results

- The developer will contribute back the aggregated and interlinked content to the Linked Open Data Cloud.
- Linking of artists will be improved.
- Metadata, visual content and reviews will be improved.
- Links to emerging Web technologies that inherit from semantics: Google RichSnippets, Facebook OpenGraph and schema.org annotation.

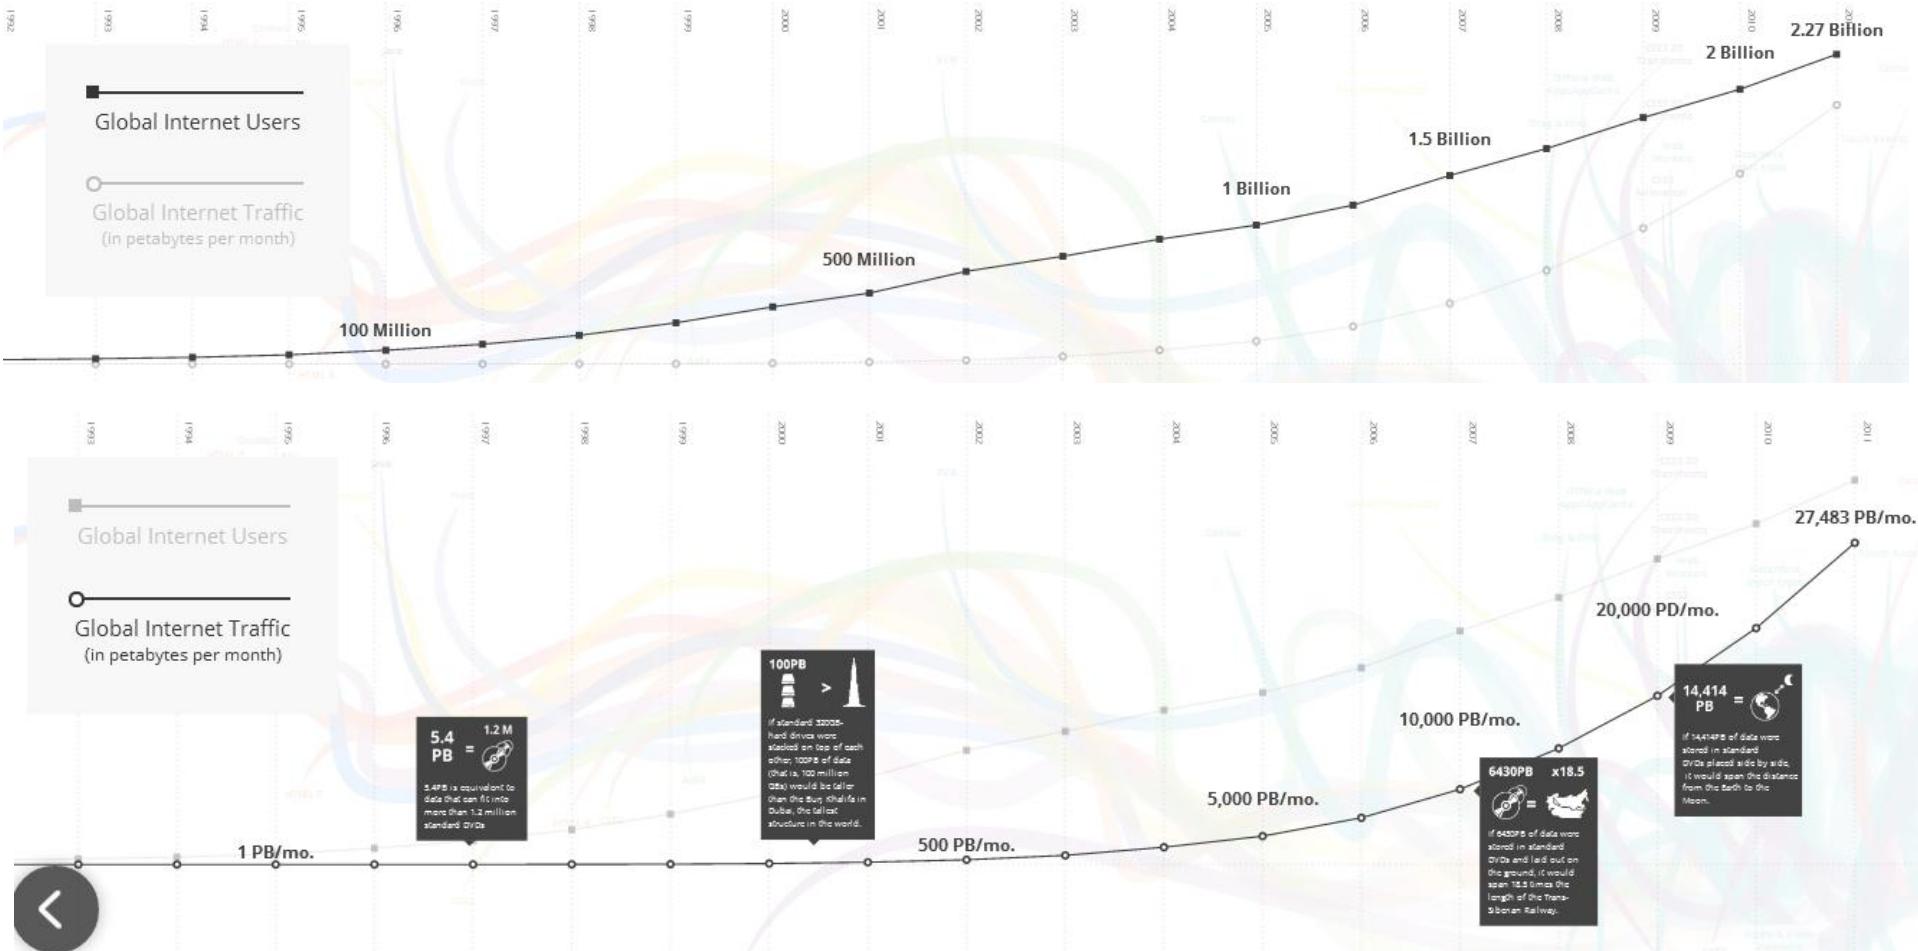

LINKED DATA FOUNDATIONS

Internet

- Extension of the technology of **computer networks**.
- The technology supporting the Internet includes the **Internet Protocol (IP)** .
- Each computer on the Internet is assigned an **IP number**.
- Messages can be **routed** from one computer to another.

Internet

The growth of the Internet

Source: <http://www.evolutionoftheweb.com>

The Web

- There is a wealth of information on the Web.
- It is aimed mostly towards consumption by humans as end-users:
 - Recognize the meaning behind content and draw conclusions,
 - Infer new knowledge using context and
 - Understand background information.

The screenshot shows the Wikipedia article for Germany. At the top is the Wikipedia logo. Below it, the page title is 'Germany'. To the left of the title is the German flag. To the right is the coat of arms of Germany. The main content area contains a summary of Germany's history, mentioning its formation around AD 100, the Migration Period, and its role in the Holy Roman Empire. It also notes the Protestant Reformation and the unification of Germany in 1871 under Prussia. The text is in German, with some English terms in parentheses.

The Web

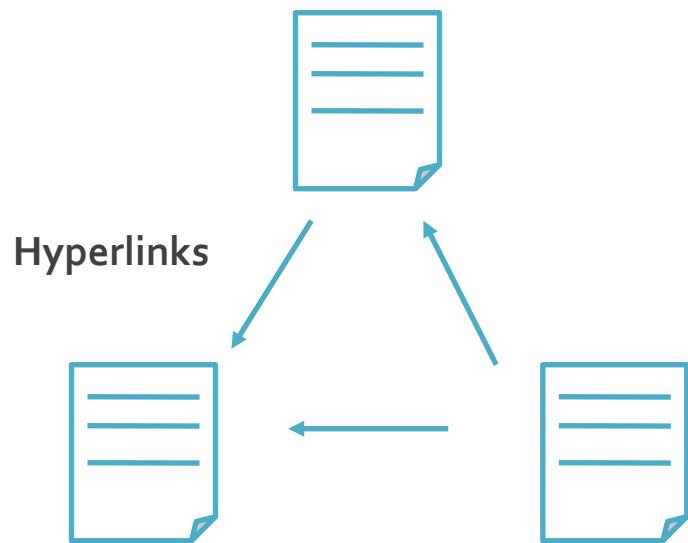

- Billions of diverse documents online, but it is not easily possible to automatically:
 - Retrieve relevant documents.
 - Extract information.
 - Combine information in a meaningful way.
- Idea:
 - Also publish machine processable data on the web.
 - Formulate questions in terms understandable for a machine.
 - Do this in a standardized way so machines can interoperate.
- The Web becomes a **Web of Data**
 - This provides a common framework to share knowledge on the Web across application boundaries.

The Web: Evolution

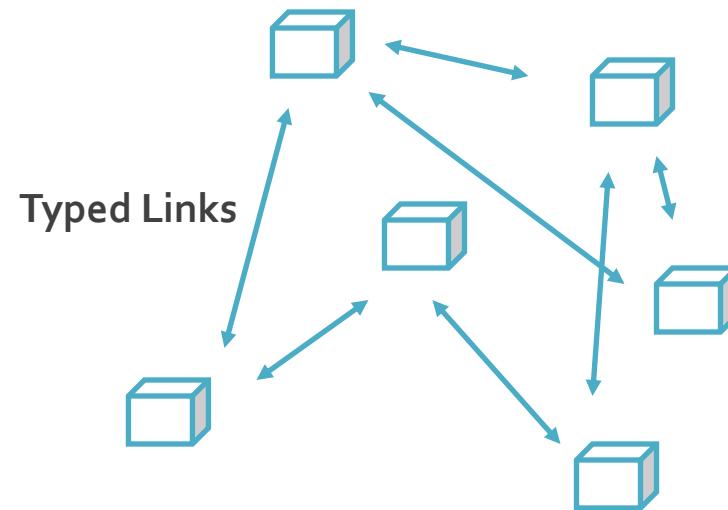

Web of Documents

Web of Data

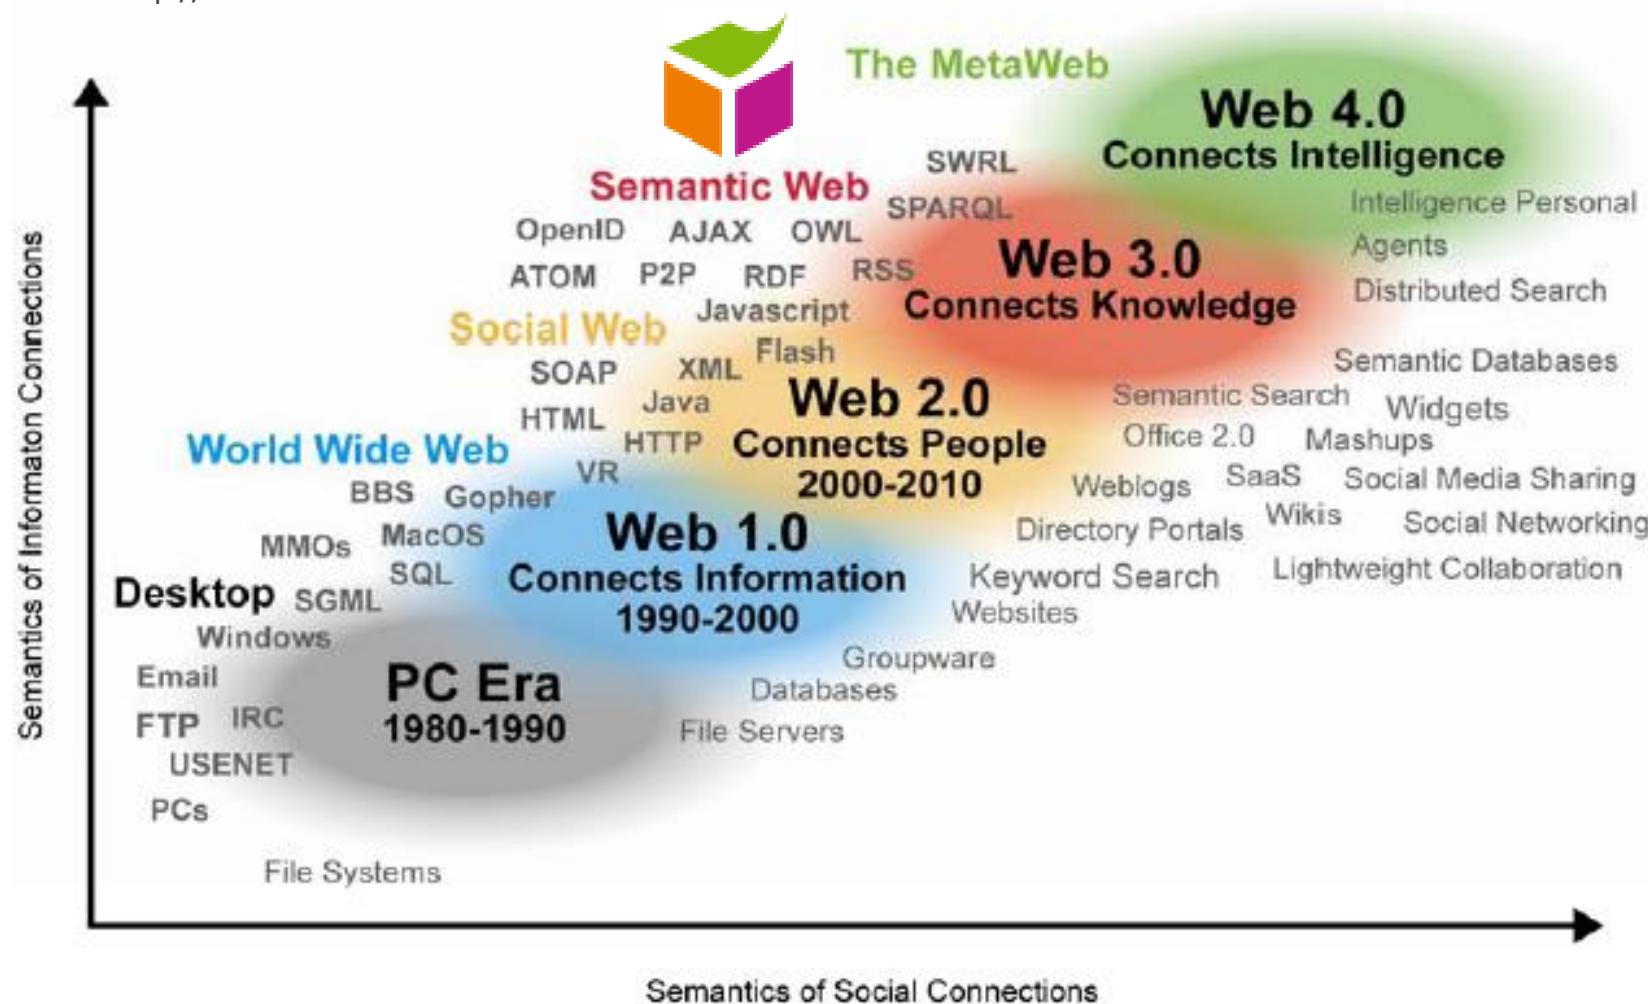

"Documents"

"Things"

The Web: Evolution

Source: <http://www.radarnetworks.com>

HTML – HyperText Markup Language

- Language for displaying web pages and other information in a web browser.
- HTML elements consist of **tags** (enclosed in angle brackets), **attributes** and **content**.

HTTP – Hypertext Transfer Protocol

- Foundation of data communication for the WWW.
- Client-server protocol.
- Every interaction is based on: **request** and **response**.

Uniform Resource Identifier (URI)

- Compact sequence of characters that identifies an abstract or physical resource.
- **Examples:**

ldap://[2001:db8::7]/c=GB?objectClass?one

mailto:John.Doe@example.com

news:comp.infosystems.www.servers.unix

tel:+1-816-555-1212

urn:oasis:names:specification:docbook:dtd:xml:4.1.2

<http://dbpedia.org/resource/Karlsruhe>

Describing Data

Vocabularies

- Collections of defined **relationships** and **classes** of resources.
 - Classes group together similar resources.
- Terms from well-known vocabularies should be **reused** wherever possible.
- New terms should be define only if you can not find required terms in existing vocabularies.

Describing Data

Vocabularies

A set of well-known vocabularies has evolved in the Semantic Web community. **Some** of them are:

Vocabulary	Description	Classes and Relationships
Friend-of-a-Friend (FOAF)	Vocabulary for describing people.	foaf:Person, foaf:Agent, foaf:name, foaf:knows, foaf:member
Dublin Core (DC)	Defines general metadata attributes.	dc:FileFormat, dc:MediaType, dc:creator, dc:description
Semantically-Interlinked Online Communities (SIOC)	Vocabulary for representing online communities.	sioc:Community, sioc:Forum, sioc:Post, sioc:follows, sioc:topic
Music Ontology (MO)	Provides terms for describing artists, albums and tracks.	mo:MusicArtist, mo:MusicGroup, mo:Signal, mo:member, mo:record
Simple Knowledge Organization System (SKOS)	Vocabulary for representing taxonomies and loosely structured knowledge.	skos:Concept, skos:inScheme, skos:definition, skos:example

Describing Data

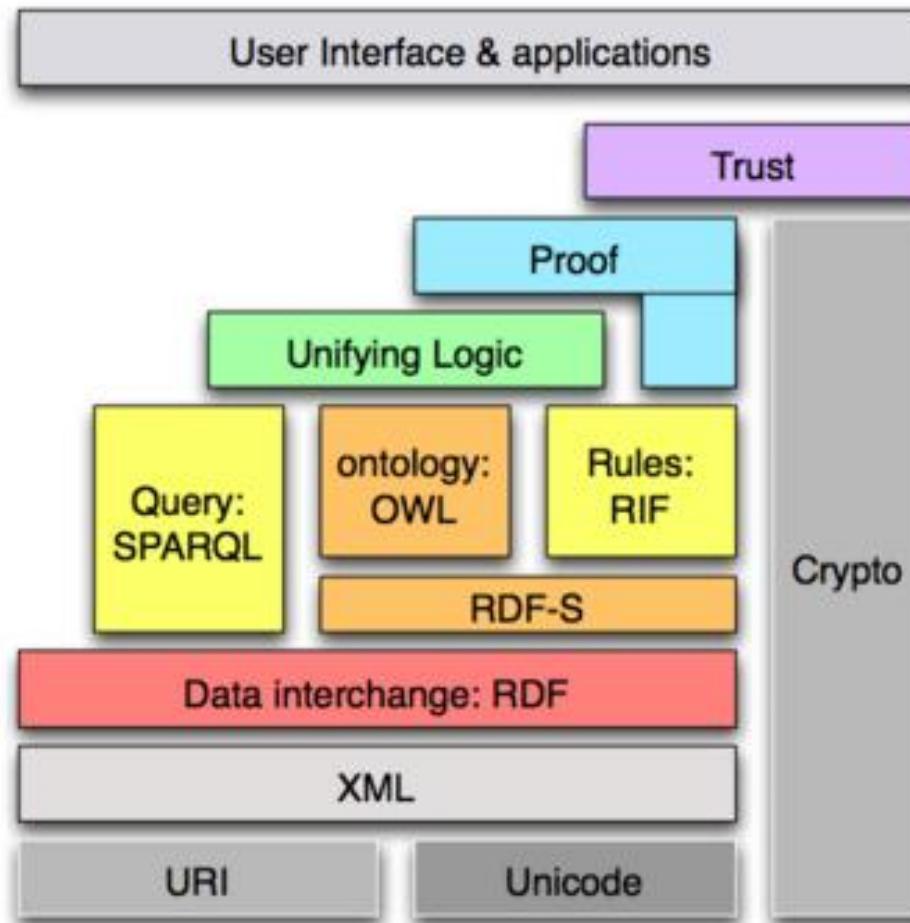

Vocabularies

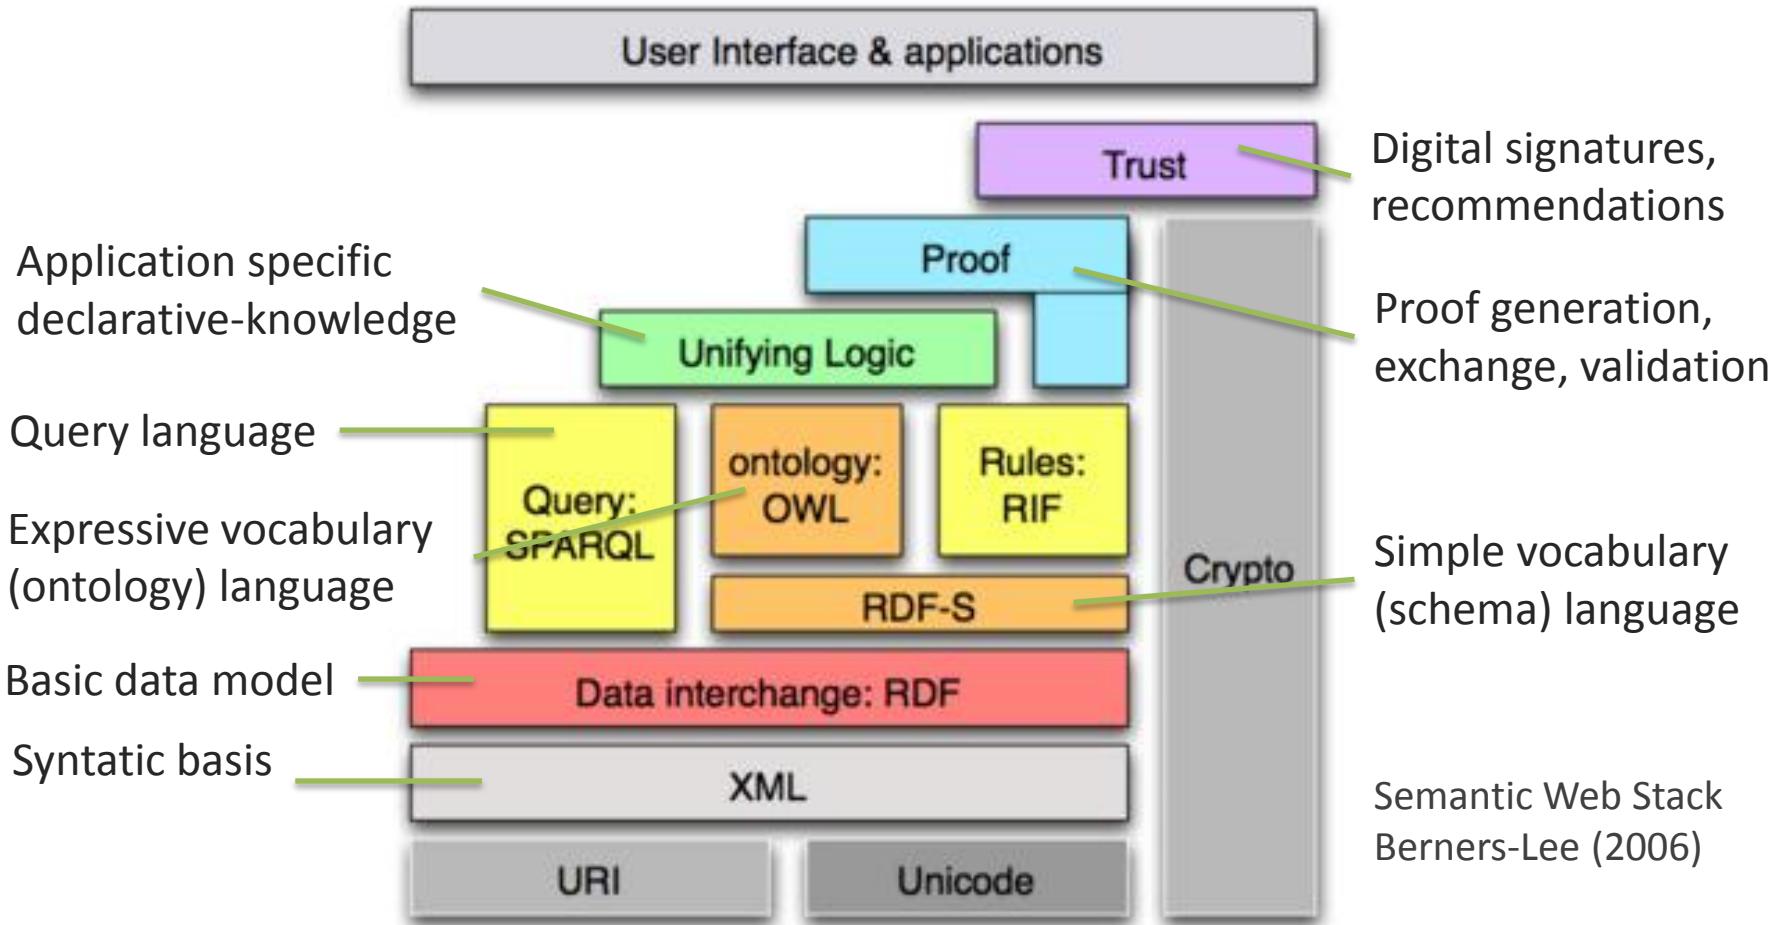

More extensive lists of well-known vocabularies are maintained by:

- W3C SWEOLinking Open Data community project
<http://www.w3.org/wiki/TaskForces/CommunityProjects/LinkingOpenData/CommonVocabularies>
- Mondeca: Linked Open Vocabularies
<http://labs.mondeca.com/dataset/lov>
- Library Linked Data Incubator Group: Vocabularies in the library domain
<http://www.w3.org/2005/Incubator/lld/XGR-lld-vocabdataset-20111025>

Semantics on the Web

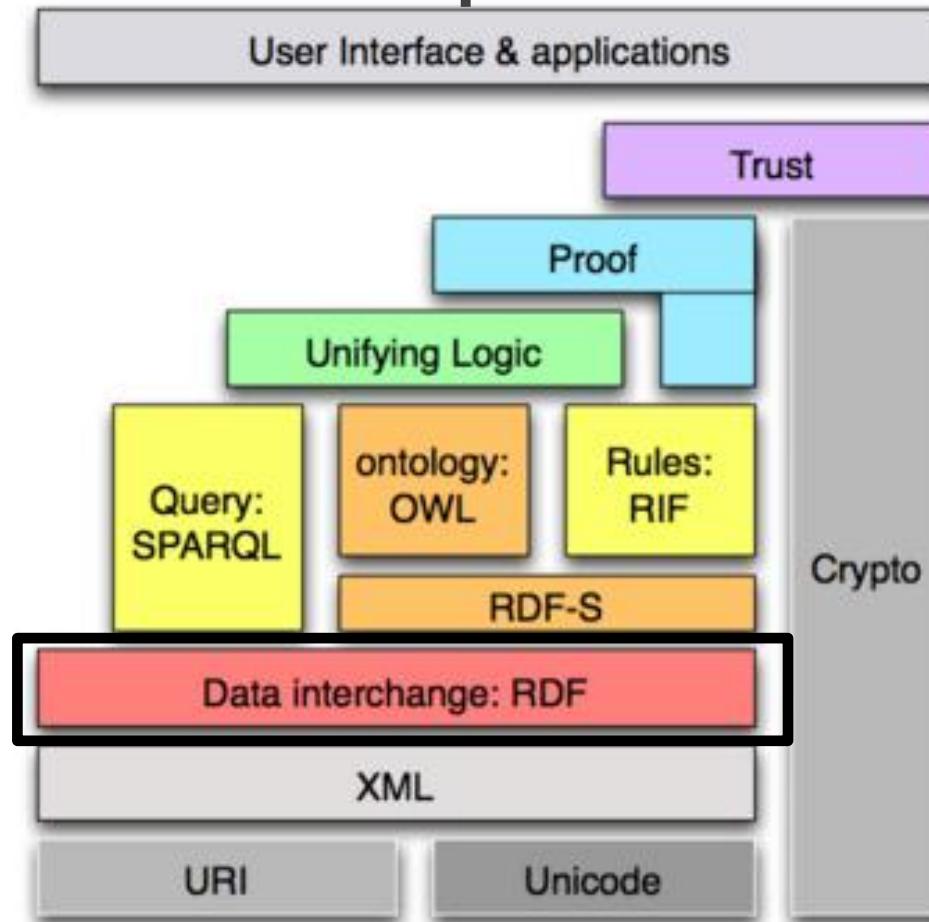

Semantics on the Web

Semantics on the Web

RDF – Resource Description Framework

RDF – Resource Description Framework

- RDF is the basis layer of the Semantic Web stack ‘layer cake’.
- Basic building block: RDF triple.
 - **Subject** – a resource, which may be identified with a URI.
 - **Predicate** – a URI-identified reused specification of the relationship.
 - **Object** – a resource or literal to which the subject is related.

Semantics on the Web

RDF – Resource Description Framework (Example)

```
<http://musicbrainz.org/artist/b10bbbfc-  
cf9e-42e0-be17-e2c3e1d2600d#_>  
<http://www.w3.org/2002/07/owl#sameAs>  
<http://dbpedia.org/resource/The_Beatles>.
```

URIs are given in angle brackets in N-Triples.

```
<http://musicbrainz.org/artist/b10bbbfc-  
cf9e-42e0-be17-e2c3e1d2600d#_>  
<http://xmlns.com/foaf/0.1/name>
```

In N-Triples every statement is terminated with a full stop.

```
"The Beatles" .
```

Literals are given in quotes in N-Triples.

Semantics on the Web

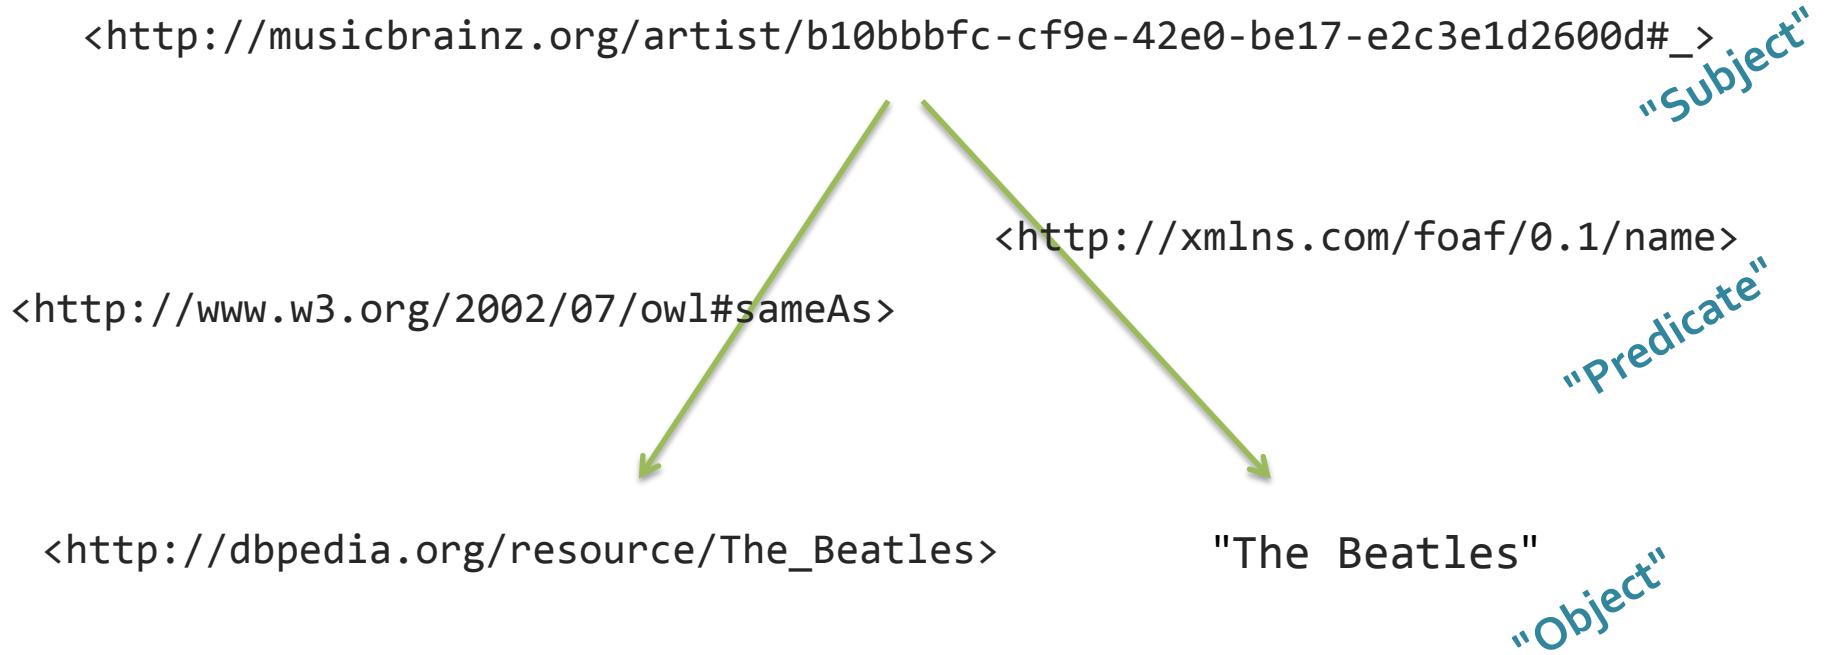

RDF Graphs

- Every set of RDF assertions can then be drawn and manipulated as a (labelled directed) graph:
 - **Resources** – the subjects and objects are nodes of the graph.
 - **Predicates** – each predicate use becomes a label for an arc, connecting the subject to the object.

Semantics on the Web

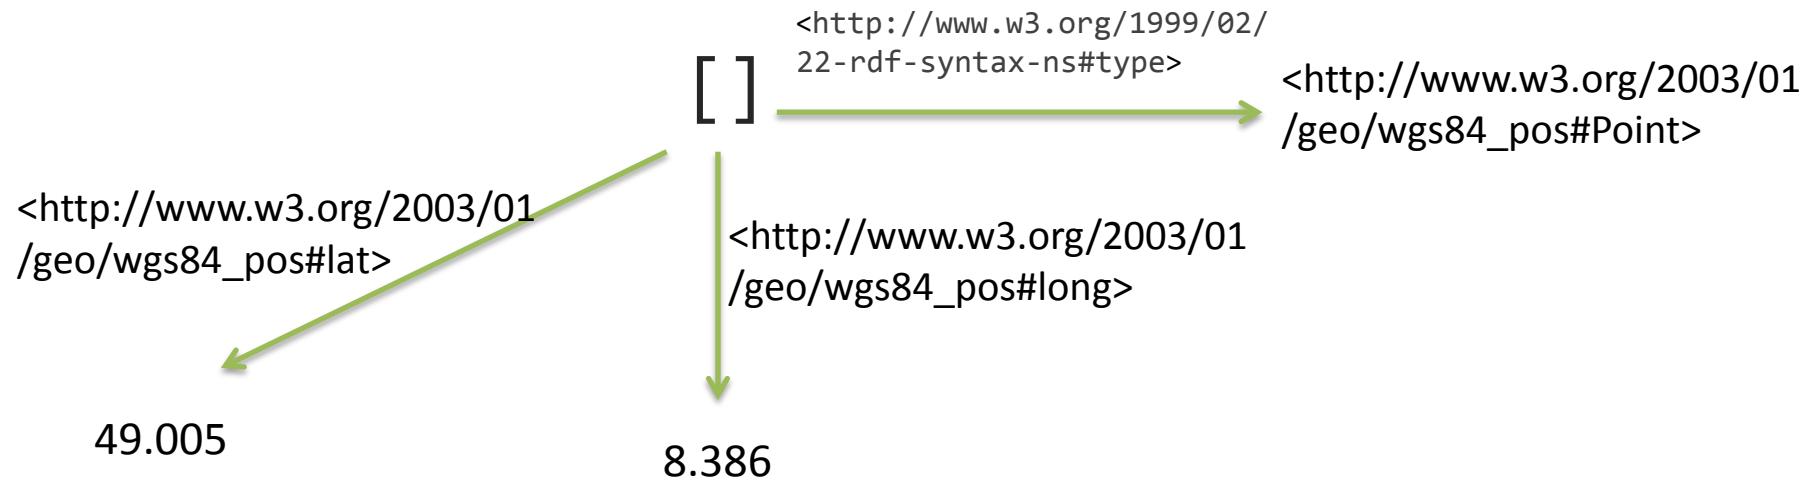

RDF Graphs (Example)

Semantics on the Web

RDF Blank Nodes

- RDF graphs can also contain unidentified resources, called *blank nodes*:

- Blank nodes can group related information, but their use in Linked Data is discouraged.

RDF Turtle

- Turtle is a syntax for RDF more readable.
- Since many URIs share same basis we use **prefixes**:

```
@prefix rdf:<http://www.w3.org/1999/02/22-rdf-syntax-ns#>.
```

```
@prefix rdfs:<http://www.w3.org/2000/01/rdf-schema#>.
```

```
@prefix owl:<http://www.w3.org/2002/07/owl#>.
```

```
@prefix mo:<http://purl.org/ontology/mo/>.
```

```
@prefix dbpedia:<http://dbpedia.org/resource/>.
```

And (sometimes) a unique base:

```
@base <http://musicbrainz.org/artist/>.
```

Semantics on the Web

RDF Turtle

- Also has a simple *shorthand* for class membership:

```
@base <http://musicbrainz.org/>.
```

```
@prefix mo:<http://purl.org/ontology/mo/>.
```

```
<artist/b10bbbfc-cf9e-42e0-be17-e2c3e1d2600d#_> a mo:MusicGroup.
```

Is **equivalent** to:

```
<http://musicbrainz.org/artist/b10bbbfc-cf9e-42e0-be17-e2c3e1d2600d#_>
```

```
  <http://www.w3.org/1999/02/22-rdf-syntax-ns#type>
```

```
  <http://purl.org/ontology/mo/MusicGroup>.
```

Semantics on the Web

RDF Turtle

- When multiple statements apply to **same subject** they can be abbreviated as follows:

```
<artist/b10bbbfc-cf9e-42e0-be17-e2c3e1d2600d#_>
  rdfs:label "The Beatles"; _____ Same subject
  owl:sameAs dbpedia:The_Beatles , _____ Same subject &
  <http://www.bbc.co.uk/music/artists/
    b10bbbfc-cf9e-42e0-be17-e2c3e1d2600d#artist> .
```

RDF Turtle

- Turtle also provides a simple syntax for **datatypes and language tags** for literals, respectively:

```
<recording/5098d0a8-d3c3-424e-9367-1f2610724410#_> a mo:Signal;  
    rdfs:label "All You Need Is Love" ;  
    mo:duration "PT3M48S"^^xsd:duration .
```

dbpedia:The_Beatles dbpedia-owl:abstract
"The Beatles were an English rock band formed (...) "@en,
"The Beatles waren eine britische Rockband in den (...) "@de .

Semantics on the Web

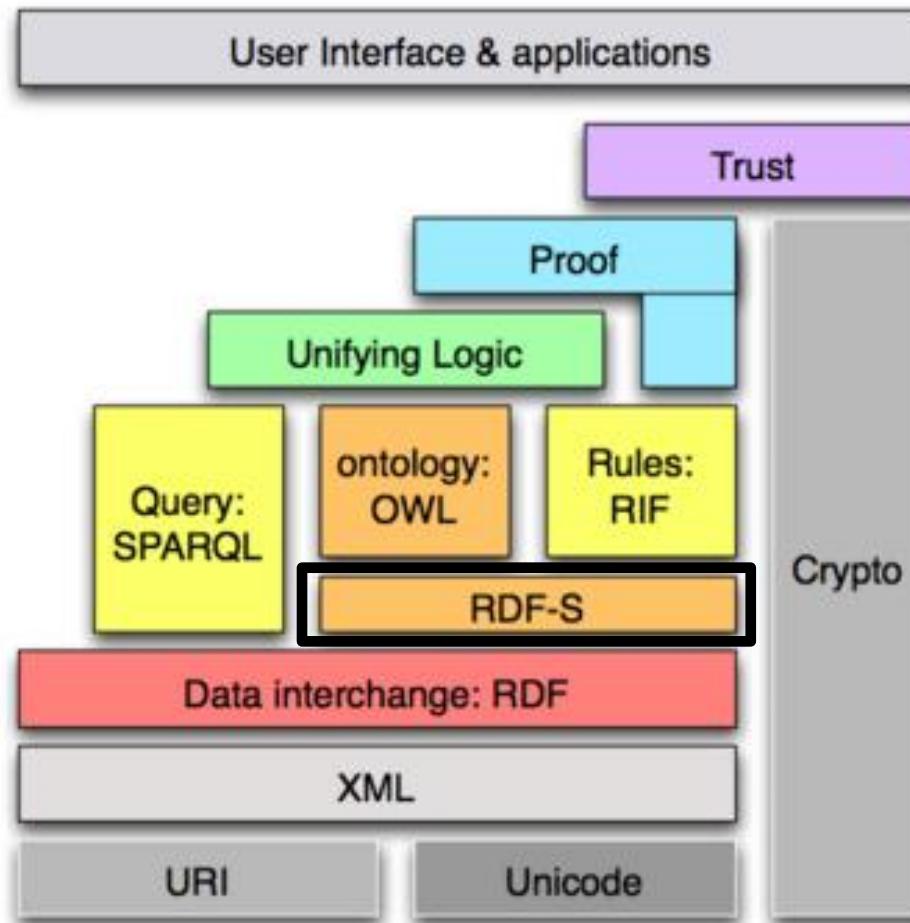

RDF/XML

- This is most useful for inter-machine communication.
- The primary (recurring) element in encoding assertions (thereby triples) is `rdf:Description`, e.g.:

```
<rdf:Description  
    rdf:about="http://musicbrainz.org/artist/b10bbbfc-cf9e-42e0-be17-e2c3e1d2600d#_">  
    <foaf:name>The Beatles</foaf:name>  
    <owl:sameAs rdf:resource="http://dbpedia.org/resource/The_Beatles">  
</rdf:Description>  
  
<rdf:Description  
    rdf:about="http://musicbrainz.org/artist/4d5447d7-c61c-4120-ba1b-d7f471d385b9#_">  
    <foaf:name>John Lennon</foaf:name>  
</rdf:Description>
```

Semantics on the Web

RDF-S – RDF Schema

RDF-S – RDF Schema

Language for two tasks w.r.t. the RDF data model:

- **Expectation** – nominate:
 - the ‘types’, i.e., *classes*, of things we might make assertions about, and
 - the *properties* we might apply, as predicates in these assertions, to capture their relationships.
- **Inference** – given a set of assertions, using these classes and properties, specify what should be inferred about assertions that are *implicitly* made.

RDF-S – RDF Schema

- **rdf:Property** - Class of RDF properties. Example:
mo:member - *Indicates a member of a musical group.*
- **rdfs:domain** - States that any resource that has a given property is an instance of one or more classes.
mo:member rdfs:domain mo:MusicGroup .
- **rdfs:range** - States that the values of a property are instances of one or more classes.
mo:member rdfs:range foaf:Agent .

Semantics on the Web

RDF-S – RDF Schema

Schema mo:MusicGroup
 rdfs:subClassOf
 foaf:Group .

Existing fact <artist/b10bbbfc-cf9e-42e0-be17-e2c3e1d2600d#_>
 rdf:type
 mo:MusicGroup .

Inferred fact

<artist/b10bbbfc-cf9e-42e0-be17-e2c3e1d2600d#_>
rdf:type
foaf:Group .

We *expect* to use this vocabulary to make assertions about music groups.

Having made such an assertion...

Inferences can be drawn that we did not explicitly make

RDF-S – RDF Schema

Resources and predicates
with (limited) **inferences**:

rdfs:Resource

rdfs:Literal, rdfs:Datatype

rdfs:Class, rdfs:subClassOf

rdfs:subPropertyOf

rdfs:range, rdfs:domain

rdf:Property (an instance of rdfs:Class)

Some predicates with
NO inferences:

rdfs:comment

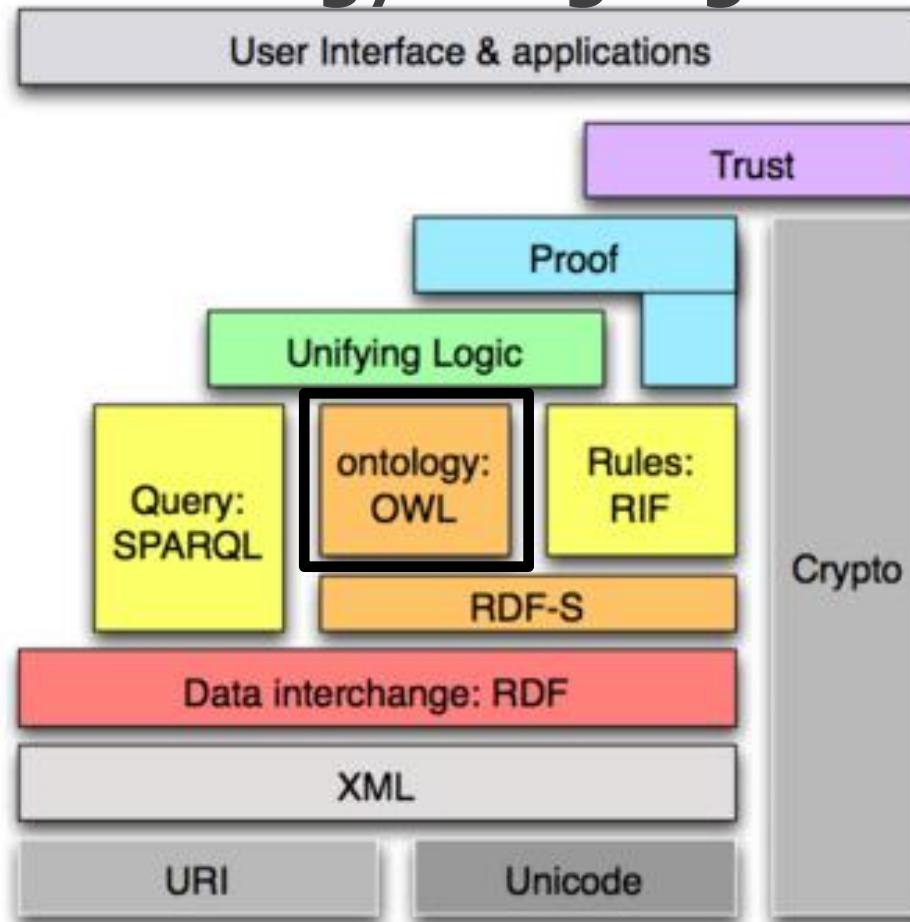

rdfs:label

rdfs:seeAlso

rdfs:isDefinedBy

Semantics on the Web

OWL – Web Ontology Language

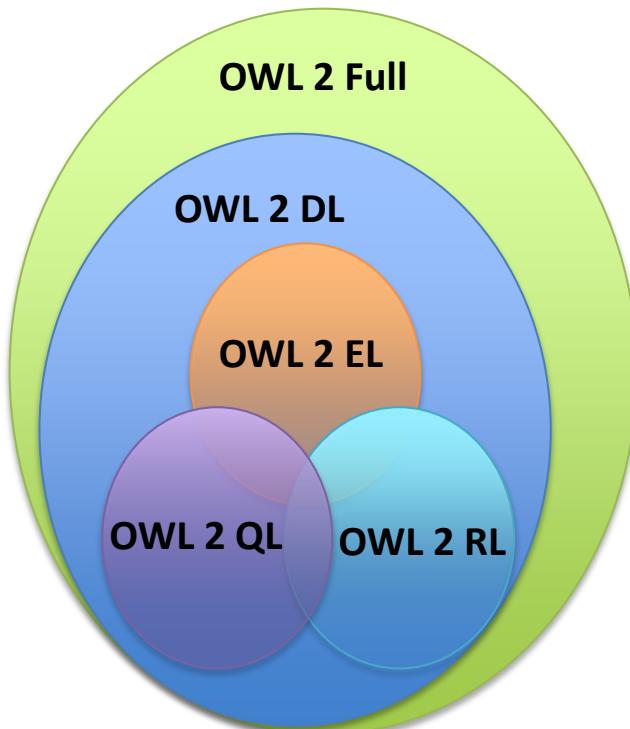

OWL – Web Ontology Language

- RDFS provides a simplified ontological language for defining vocabularies about specific domains.
- Sometimes it is necessary to have access to a wider range of ontological constructs.
- **Web Ontology Language (OWL)** provides more ontological constructs and avoids some of the potential confusion in RDF-S.

OWL 2.0 – Web Ontology Language 2.0

Extends the DL further, but has three more computable fragments (profiles).

OWL 2 Full

- Used informally to refer to RDF graphs considered as OWL 2 ontologies and interpreted using the RDF-Based Semantics.

OWL 2 DL

- Used informally to refer to OWL 2 DL ontologies interpreted using the Direct Semantics.

OWL 2 EL

- Limited to basic classification, but with polynomial-time reasoning.

OWL 2 QL

- Designed to be translatable to relational database querying.

OWL 2 RL

- Designed to be efficiently implementable in rule-based systems.

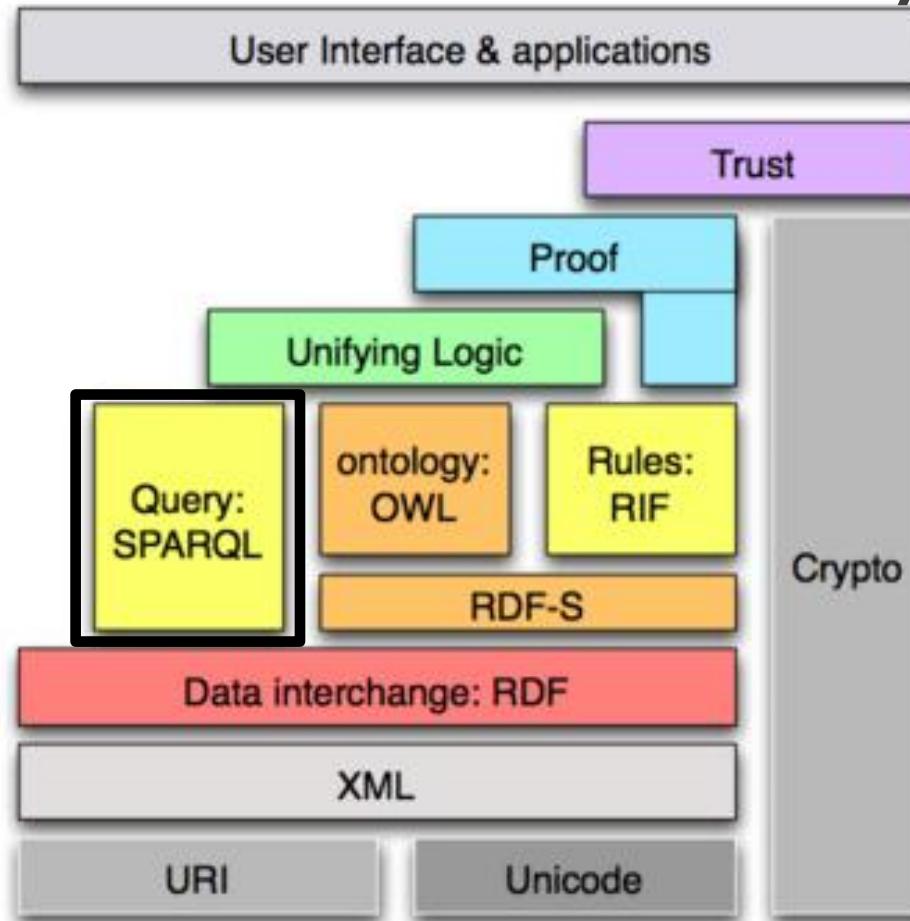

OWL – Web Ontology Language

OWL is made up of **terms** which provide for:

- **Class construction:** forming new classes from membership of existing ones (e.g., unionOf, intersectionOf, etc.).
- **Property construction:** distinction between OWL ObjectProperties (resources as values) and OWL DatatypeProperties (literals as values).
- **Class axioms:** sub-class, equivalence and disjointness relationships.
- **Property axioms:** sub-property relationship, equivalence and disjointness, and relationships between properties.
- **Individual axioms:** statements about individuals (sameIndividual, differentIndividuals).

Semantics on the Web

SPARQL – * Protocol and RDF Query Language

SPARQL – * Protocol and RDF Query Language

- Query language designed to use a syntax similar to SQL for retrieving data from relational databases.
- Different query forms:
 - **SELECT** returns variables and their bindings directly.
 - **CONSTRUCT** returns a single RDF graph specified by a graph template.
 - **ASK** test whether or not a query pattern has a solution.
Returns yes/no.
 - **DESCRIBE** returns a single RDF graph containing RDF data about resources.

SPARQL – * Protocol and RDF Query Language

- The syntax of a **SELECT** query is as follows:
 - **SELECT** nominates which components of the matches made against the data should be returned.
 - **FROM** (optional) indicates the sources for the data against which to find matches.
 - **WHERE** defines patterns to match against the data.
 - **ORDER BY** defines a means to order the selected matches.

SPARQL – * Protocol and RDF Query Language

Retrieve the names of the albums and tracks recorded by The Beatles.

PREFIX dc: <<http://purl.org/dc/elements/1.1/>>

PREFIX foaf: <<http://xmlns.com/foaf/0.1/>>

PREFIX music-ont: <<http://purl.org/ontology/mo/>>

SELECT ?album_name ?track_title

WHERE {

 <<http://musicbrainz.org/artist/b10bbbfc-cf9e-42e0-be17-e2c3e1d2600d#>>

 foaf:made ?album .

 ?album dc:title ?album_name ;

 music-ont:track ?track .

 ?track dc:title ?track_title . }

SPARQL – * Protocol and RDF Query Language

SQL

Based on relations (tables).

The relations (tables) to be matched over should be indicated.

(Retrieval) queries produce a relation from a relation.

SPARQL

Based on labelled directed graphs.

Assumes a default graph.
(The FROM clause populates this with specific identified subgraphs).

SPARQL SELECT queries produce a relation from a graph.
CONSTRUCT queries (considered later) produce a graph from a graph.

SPARQL – * Protocol and RDF Query Language

- SPARQL 1.1 provides graph update operations:
 - **INSERT DATA:** adds explicit triples, given inline.
 - **DELETE DATA:** removes explicit triples, given inline.
 - **DELETE/INSERT WHERE:** updates based on triples calculated from WHERE clause (as in SELECT and CONSTRUCT).
 - **LOAD:** reads the content of a document into a graph.
 - **COPY/MOVE/APPEND:** manipulates at named graph level.
 - **CLEAR/DROP:** removes all triples in one or more graph.

Semantics on the Web

SPARQL – * Protocol and RDF Query Language

Insert the following albums recorded by The Beatles into the graph

http://myFavGroups/The_Beatles

PREFIX dc: <<http://purl.org/dc/elements/1.1/>>

PREFIX foaf: <<http://xmlns.com/foaf/0.1/>>

```
INSERT DATA { GRAPH <http://myFavGroups/The\_Beatles> {
<http://musicbrainz.org/artist/b10bbbfc-cf9e-42e0-be17-e2c3e1d2600d#>
    foaf:made <http://musicbrainz.org/release/3a685770-7326-34fc-9f18-e5f5626f3dc5#> ,
                <http://musicbrainz.org/release/cb6f8798-d51e-4fa5-a4d1-2c0602bfe1b6#> .

<http://musicbrainz.org/release/3a685770-7326-34fc-9f18-e5f5626f3dc5#>
    dc:title "Please Please Me".

<http://musicbrainz.org/release/cb6f8798-d51e-4fa5-a4d1-2c0602bfe1b6#>
    dc:title "Something New". } }
```

Semantics on the Web

SPARQL – * Protocol and RDF Query Language

Delete all the information about the album *Casualties* of The Beatles.

```
PREFIX dc: <http://purl.org/dc/elements/1.1/>
```

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
```

```
DELETE { ?album ?predicate ?object . }
```

```
WHERE {
```

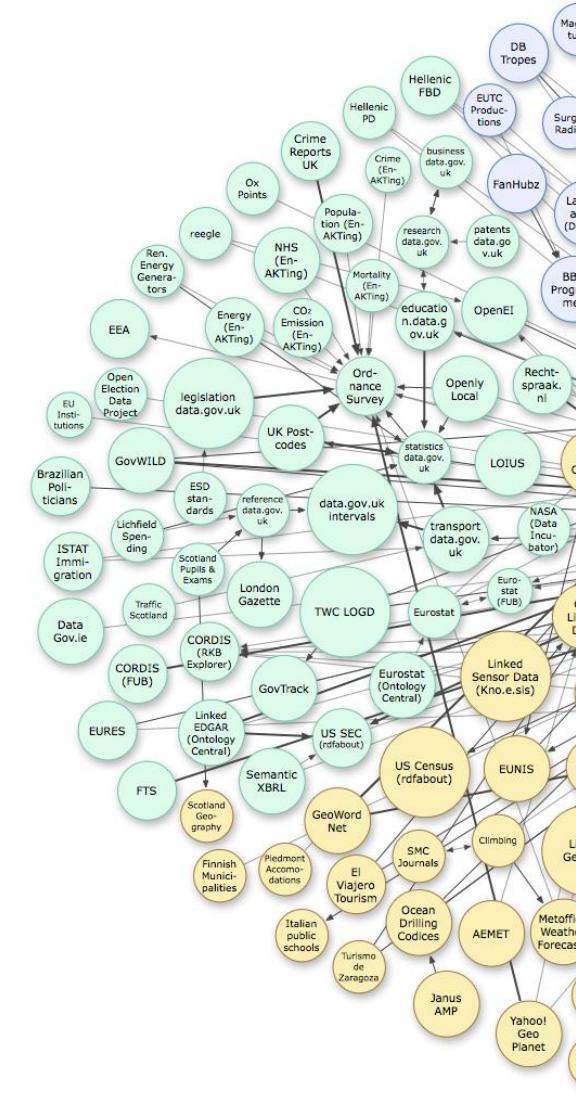

```
<http://musicbrainz.org/artist/b10bbbfc-cf9e-42e0-be17-e2c3e1d2600d>
```

```
    foaf:made ?album .
```

```
    ?album dc:title "Casualties";
```

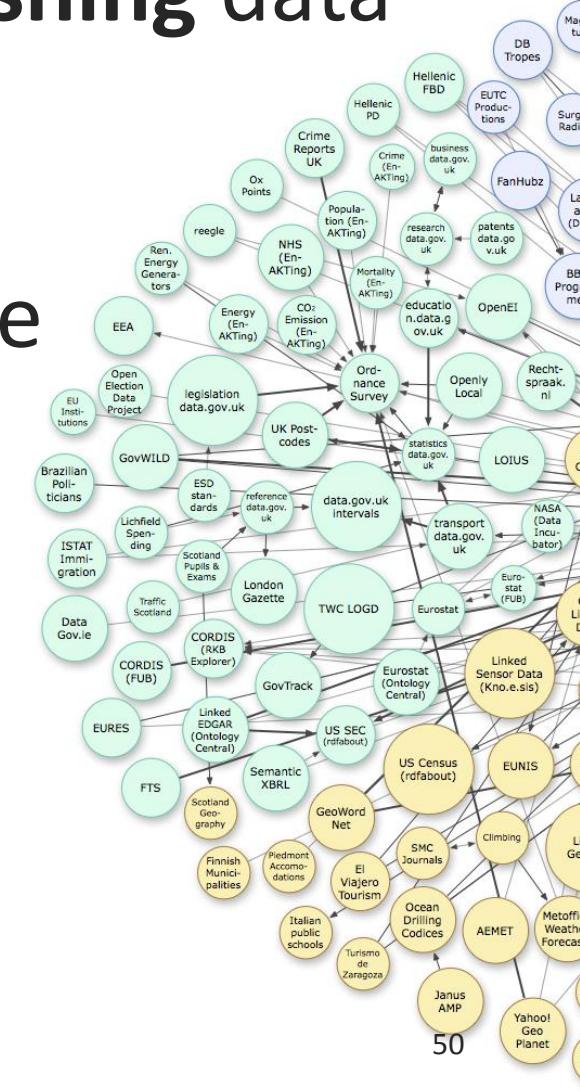

```
        ?predicate ?object .}
```

INTRODUCTION TO: LINKED DATA

Linked Data

- Set of best practices for publishing data on the Web.
 - Data from different knowledge domains, self-described, linked and accessible.
 - Follows 4 simple principles...

Linked Data Principles

1. Use URIs as **names** for things.
2. Use HTTP URIs so that users can **look up** those names.
3. When someone looks up a URI, **provide useful information**, using the standards (RDF*, SPARQL).
4. Include links to other URIs, so that users can **discover** more things.

Linked Data Principles

1. Use URIs as **names** for things.

- A foundational issue in Linked Data was the distinction of URIs for **object documents** that might describe them.

Linked Data Principles

2. Use HTTP URIs so user can **look up** those names.

- HTTP allows a second way to distinguish real-world objects from documents.
- Best practice says HTTP 303 and Location header should be used.

Linked Data Principles

3. When someone looks up a URI, **provide useful information**, using the standards (RDF*, SPARQL, Turtle¹).

- While RDF/XML should be the default for look-up.
 - RDFa annotations in HTML are now also standard.
- SPARQL endpoint for queries are encouraged, or a dump of the whole dataset.

¹ To become a standard.

Linked Data Principles

3. When someone looks up a URI, **provide useful information**, using the standards (RDF*, SPARQL, Turtle¹).

What to return for a URI?

- **Immediate description:** triples where the URI is the subject.
- **Backlinks:** triples where the URI is the object.
- **Related descriptions:** information of interest in typical usage scenarios.
- **Metadata:** information as author and licensing information.
- **Syntax:** RDF descriptions as RDF/XML and human-readable formats.

Source: *How to Publish Linked Data on The Web* - Chris Bizer, Richard Cyganiak, Tom Heath.

Linked Data Principles

4. Include links to other URIs, so that users can **discover** more things.

There are several ways to reuse URIs:

- direct **reuse**
- (OWL) **sameAs**
- (RDFS) **seeAlso**

} Instance Level

- direct **reuse** of class/property
- (RDFS) **sub-class/-property**
- (OWL) **equivalent class/property**
- SKOS **broad match**

} Schema Level

Linked Data 5 Star

- ★ Data is available on the Web.
- ★★ Data is available as machine-readable structured data.
- ★★★ Non-proprietary formats are used.
- ★★★★ Individual data identified with open standards.
- ★★★★★ Data is linked to other data provider.

Linked Data 5 Star

Example:

My Data

**THE
BEATLES**

"John Lennon"

"Paul McCartney"

"George Harrison"

"Ringo Starr"

Please Please Me - 1963 • With The Beatles - 1963
A Hard Day's Night - 1964 • Beatles For Sale - 1964
Help! - 1965 • Rubber Soul - 1965
Revolver - 1966
Sgt. Pepper's Lonely Hearts Club Band - 1967
White Album - 1968
Abbey Road - 1969
Magical Mystery Tour - 1967
Yellow Submarine - 1969
Let It Be - 1970
Past Masters - 1988

Linked Data 5 Star

Data is available on the Web

My Data

**THE
BEATLES**

Exploring the Web of Data

- **Linked Data browsers**
- **Linked Data mashups**
- **Search engines**

Linked Data Browsers Marbles

The screenshot shows the Marbles browser interface for the URI <http://www.w3.org/People/Berners-Lee/card#>. The main area displays Tim Berners-Lee's profile card, which includes his name, gender (Male), birth date (1955-06-08), and a photo of him. Below the card, there are sections for 'Weblinks' (including a link to his w3.org page) and 'Sources' (listing various URLs from which the data was retrieved). The interface uses colored circles to represent different types of links or entities.

<http://marbles.sourceforge.net>

Reviews (1)

[by tom on 30 Jan 2007](#)

Broken Flowers provides a fantastic vehicle for a classic deadpan Bill Murray performance. The film centers around his character Don, who one day receives a letter from an ex-girlfriend, telling him he has a teenage son. The letter is unsigned, so (with encouragement from his neighbour) he sets off round the country, visiting each of the exes who could be the mother of his son. Predictably they're all different in personality and life situation, giving plenty of raw material for awkward silences and dubious encounters. This is great viewing for any Bill Murray fans, or anyone who likes their humour intelligent and a little bit quirky. The soundtrack is also excellent, and deserves a separate review.

Tim Berners-Lee

picture:  [9,11,12,14,15,17,18,19,20]  [9,10,13]

given name: Tim [1,11,12,14,15,17,18,19,20]

family name: Berners-Lee [1,11,12,14,15,17,18,19,20]

comment: Sir Timothy John "Tim" Berners-Lee, OM, KBE, FRS, FREng, FRSA (born 8 June 1955, also known as "TimBL"), is a British engineer and computer scientist and MIT professor credited with inventing the World Wide Web, making the first proposal for it in March 1989. On 25 December 1990, with the help of Robert Cailliau and a young student at CERN, he implemented the first successful communication between an HTTP client and server via the Internet.

Some Application Scenarios

BBC

Screenshot of the BBC Music website featuring The Beatles.

The page includes the BBC logo, sign-in options, and navigation links for News, Sport, Weather, iPlayer, TV, Radio, More..., London 2012, and Search.

A "MUSIC" section highlights "The Beatles" with their formation date (1957) and disbandment date (10 April 1970).

A video player shows a BBC Two clip from "Arena" featuring The Beatles performing. The video player interface includes a play button, volume control, and a progress bar.

On the right side, there's a "Share This Page" section with links for Share, Facebook, and Twitter, and a BBC Radio 2 logo.

A "BBC Music Showcase" section offers a "BBC MUSIC SHOWCASE" with a call to action: "Watch and listen to exclusive music clips".

The "Latest Tracks Played On The BBC" section lists tracks like "Twist & Shout" (BBC Radio 2), "Tomorrow Never Knows" (BBC 6 Music), "She Loves You" (BBC Radio 2), and "Sgt Pepper's Lonely Hearts/With A Little Help" (BBC Radio 2).

Summary

In this chapter we studied:

- **The Web** and its evolution.
- Web technology basics: **HTTP**, **HTML**, **URI**.
- **Vocabularies** to describe data.
- The **Semantic Web stack**: RDF, RDF-S, OWL, SPARQL.
- **Linked Data** concept and principles.
- Evolution of the **LOD cloud**.
- Browsers, mashups and search engines to **explore the Web of Data**.
- Some **application** scenarios.
